                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequence given represents the human rhodopsin cDNA. Mutant versions of this sequence encode proteins which cause retinal degeneration. These sequences may be identified using primers/ probes described in the invention (see also Q43545-48) and may be used to diagnose hereditary retinal degeneration. This sequence is the closest approximation to the gene sequence as the sequence given in the specification is not printed clearly.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         08-DEC-1992;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WO9312134-A.

This fragment contains coding regions for ORF65 which encodes capsid protein IV, ORF66, ORF67 which encodes to the necodes a glycoprotein, ORF69, K12 which encodes kaposin, K13, ORF72 which encodes cyclin D, ORF73 which encodes immediate early protein (IEP), K14 which encodes OX-2 (v-adh), ORF74 which encodes G-protein coupled receptor, ORF75 which encodes tegument protein/FGGRAT, K15, KSHV is a new human the Herpesvirus (HHV8) believed to cause Kaposi's sarcoma (KS) which is the most common form of neoplasm occurring in persons with acquired immune deficiency syndrome (AIDS). The DHFR protein is useful for vaccination, prophylaxis, diagnosis and treatment of a subject with Kaposi's sarcoma and for detecting expression of a DNA virus associated with Kaposi's

This sequence represents the long unique region and terminal repeat of CC the Kaposi's sarcoma-associated herpes virus (KSHY). KSHV is also known as human herpes virus 8 (HHY8). This sequence contains the DNAs of the CC invention which encode KSHY polypeptides selected from: (a) viral CC (c) viral IRF 1; (d) complement-binding protein; glycoproteins B, M or L; CC (d) capsid protein IV encoded by ORF65; and (e) immediate early protein encoded by ORF73. Labelled probes for the nucleic acid, proteins encoded by 1t, and antibodies (Ab) specific for the proteins are useful for CC detecting HHV8, specifically for diagnosis of Kaposi's sarcoma, in body fluids or tissue samples. HHV8 infections can be tracted with antisense CC protein. Ab may be used for prophylaxis or treated with antisense CC while the protein can be used in protective vaccines. Ab may also be used to differentiate between lymphomas, and HHV8 may be implicated in many CC splenomegaly and mycosis fungoides. Cells and animals containing the nucleic acid are useful for drug screening. HHV8-derived peptides can be inhibited with methotrexate. These can also be used to determine CC used as targets for antiviral drugs, e.g. dihydrofolate reductase gene the immune status of a patient infected with HIV. HHV8 derived protein CC e.g. treating rheumatoid arthritis. This sequence is stated as containing containing the many reading rheumatoid arthritis. This sequence is stated as containing the containing the many and the containing

                                                                                                                                                                                                                                                               Sequences T79063-66 represent novel allelic genes of the Xenopus laevis melatonin receptor MEL-IA. The sequences encode proteins which are 65 amino acids shorter than those described in the prior art. Also the last 2 C-terminal amino acids encoded by these sequences are different from the previously known proteins. This sequence is a short form of the novel receptor MEL-IAA also known as Mel 1-c(alpha). As compared to the long form (T79063), the difference occurs in the 3' untranslated region (both sequences encode the same protein), which is thought to affect the half-life of the mRNA. The nucleotide sequence was isolated from CDNA derived from Xenopus skin RNA and amplified using the primers T79067-76. The nucleotide sequence was isolated from control inhibit adenylyl cyclase, but both protein MEL-IAA has been shown to inhibit adenylyl cyclase, but both proteins can modulate intracellular scape.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CDS

The sequences encode proteins which are 65 amino acids shorter than those described in the prior art. This sequence is a short form of the novel receptor MEL-1Ab also known as compared to the short form (T79066), the difference occurs in the 3' untranslated region (both sequences encode the same protein), which is thought to affect the half-life of the mRNA. The MEL-1Ab sequences also differ from known MEL-1A receptor sequences by 6 amino acids. The nucleotide sequence was isolated from CDNA derived from Xenopus skin RNA and amplified using the primers T79067-76. The nucleotide sequence was isolated from Sequence encodes a protein which is a 7 transmembrane receptor intracellular CGMP, esp. inhibiting its accumulation induced by an inhibitor of phosphodiesterase, but unlike MEL-1Aa (T79063) cannot to

                                                                                                                                                                                                                                                                                                                                                                                                                                                 melatonin receptor MEL-1A. The sequences encode proteins which are 65 amino acids shorter than those described in the prior art. Also the last 2 C-terminal amino acids encoded by these sequences are different from the previously known proteins. This sequence is a long form of the novel receptor MEL-1Aa also known as Mel 1-c(alpha). As compared to the short form (779064), the difference occurs in the 3' untranslated region (both sequences encode the same protein), which is thought to affect the sequences encode the same protein), which is thought to affect the half-life of the mRNA. The nucleotide sequence was isolated from CDNA derived from Xenopus skin RNA and amplified using the primers T79067-76. The nucleotide sequence encodes a protein which is a 7 transmembrane receptor involved in cellular signalling. MEL-1Aa has been shown to inhibit adenylyl cyclase, but both proteins can modulate intracellular components of the proteins can modulate intracellular shows before a protein scan modulate intracellular show
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Xenopus laevis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New nucleic acid encoding functional melatonin receptor of Xenopus for screening for potential (ant)agonists useful for e.g. treating cardiovascular disease and cancer

The sequences encode proteins which are 65 cc amino acids shorter than those described in the prior art. This sequence is a long form of the novel receptor MEL-1Ab also known as Mel 1-c(beta). CC As compared to the short form (T79066), the difference occurs in the 3' cc untranslated region (both sequences encode the same protein), which is CC thought to affect the half-life of the mRNA. The MEL-1Ab sequences also CC differ from known MEL-1A receptor sequences by 6 amino acids. The CC uncleotide sequence was isolated from cDNA derived from Xenopus skin RNA cand amplified using the primers T79067-76. The nucleotide sequence cc encodes a protein which is a 7 transmembrane receptor involved in CC cellular signalling. MEL-1Ab has been shown to modulate intracellular CC coMF, sep. inhibiting its accumulation induced by an inhibitor of CC comparativity.
                                                                                                              Align seg 1/1 to: T79065

                                                                                                                                                                                                                                                                                                                                                                                                                                                         pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               protein search, using sw model

The PNs are also stated to be useful for gene therapy. Other activities include inhibiting the growth, infection or function of bacteria, fungi, viruses and other parasites; effecting bodily characteristics such as e.g. weight, color, skin, etc., effecting biorhythms or caricadic cycles; enhancing fertility; treatment of depression; treatment of pain; hormonal or endocrine activity.

The PNS and proteins of the invention are predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional

```

The sequence given represents the human rhodopsin protein. Mutant rhodopsin proteins cause retinal degeneration. The DNA encoding the mutant DNA sequences may be identified using primers/probes described in the invention (see also 043345-48) and may be used to diagnose Probe or primer contg. sequence of human retinal degeneration slow protein mutant - used to diagnose hereditary retinal degenerative diseases 39 mlaaym---fliivlgfpinfltlyvtv------qhkklrtplnyillnlavadlfmv 1 MLESHLIIYFLLAVIQFLLGIFTNGIIVVVNGIDLIKHRKM-APLDLLLSCLAVSRIFLQ gidyytlkpevnne---sfviymfvvhftipmiiiffcygqlvftvkeaaaqqqes-att ----HPL----FIW----LKMRISKLVPWMILGSLLYVSMICVFHSKYAGFMVPYFLR---LFIFYVNVIVIFFIEFIMCSANCAILLFI----NELELW----LATWLGVFYCAKVASVR 111 RVPGRGAPISALLSILSFLILYFSHCMIKVFLSSLKFHIRRFIFL----FFILVIGIYPS --KFFSQNATIQKEDTLAIQIFSFVAEFSVPLLIFLFAVLLLIFSLGRHTRQMRNTVAGS lggftstlytslhgyfvfgptgcnlegffatlggeialwslvvlaieryvvvckpmsnfr fgenhaimgvaftwvmalacaapplagw-----sry----ipeglqcsc 187 /note= "Sequence unclear at this position" 8.2%; Score 124.5; DB 1 20.8%; Pred.                                                                                                                                                                                                                                                                                                                                                          This sequence represents human rhodopsin, and is encoded by sequences T17115 (without introns) and T17116 (with introns). Substitution of histidine for the normal nonpolar amino acid proline at position 23 results in a dysfunctional or absent molecule, affecting rod function, and is linked with autosomal dominant retinitis pigmentosa. Probes and primers specific for this mutation may be used as diagnostic agents. Mutations in the cGMP-phosphodiesterase genes are also implicated in retinitis pigmentosa. Detection of any of these mutations in a foetus or patient may be used in diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Diagnosis of hereditary retinal degenerative diseases e.g. retinitis pigmentosa, - caused by a human photoreceptor protein mutation, by detection of the mutation by PCR amplification or hybridisation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; rhodopsin; transversion; mutation; retinitis pigmentosa;

                                                                                                                                                                                                                                                proteins selected from cAMP, adenosine, muscarinic acetylcholine, proteins selected from cAMP, adenosine, muscarinic acetylcholine, adrenergic, thrombin, endothelin, bombesin, endocrine, rhodopsin, opsin adrenergic, tytomegaloviral and other G-protein coupled receptors. The receptor proteins were used to design polypeptides, pref. based on the transmembrane domains, for use in G-protein coupled receptor ligand binding assays. The polypeptide fragments retain biological activity such as binding a GPR ligand or modulating GPR ligand binding to a GPR (see R48759-R48758, R50569-R50807 and R89189-R89195 for examples of polypeptide fragments). The polypeptide fragments can be used in compositions for treating subjects suffering from a pathology related ta GPR abnormality e.g. a psychotic disorder such as schizophrenia.

                                                                                                         were used to design polypeptides, prof. based on the transmembrane domains, for use in G-protein coupled receptor ligand binding assays. The polypeptide fragments retain biological activity such as binding a GPR ligand or modulating GPR ligand binding to a GPR (see W0747-W02999 for examples of polypeptide fragments). The polypeptide fragments can be used in compositions for treating subjects suffering from a pathology related to a GPR abnormality e.g. a psychotic disorder such as
                                                                                                                                                                                                 Proteins W02657-W02730 represent a range of G-protein coupled receptor (GPR) proteins selected from cAMP, adenosine, muscarinic acetylcholine, adrenergic, thrombin, endothelin, bombesin, endocrine, rhodopsin, opsin odorant, cytomegaloviral and other GPR proteins. The receptor proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        schizophrenia; dopamine; cAMP;

This polypeptide comprises HNFDY20, a novel human 7-transmembrane 6-protein coupled receptor that shows about 30.8% identity in 299 amino acid residues with the thrombin receptor. Its amino acid sequence with the thrombin receptor. Its amino acid sequence was deduced from an isolated HNFDY20 polynucleotide sequence (see V53631). The invention relates to HNFDY20 polypeptides and recombinant materials and methods for their
                                                                                                                                                  New polynucleotides and polypeptides encoding a novel human 7-transmembrane receptor - useful for diagnosing and treations cancer, osteoporosis and Parkinson's disease and infections

Gene therapy using RNA encoding HNFDY20 can be used to treat conditions caused by under-expression of the protein. The invention also relates to methods of identifying agonists and antagonists and for using such compounds to treat conditions associated with HNFDY20 imbalance. Diagnostic assays for detecting diseases associated with inappropriate HNFDY20 activity or levels are also provided.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              production. It also provides methods for using such polypeptides and HNPDY20 polynucleotides for treatment of infections such as bacterial, fungal, protozoan and particularly HIV-1 or HIV-2 infections, and conditions including pain, cancers, anorexia, asthma, Parkinson's disease, acute heart failure, hypotension,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence

This sequence is a new form of the melatonin receptor designated MEL-1Aa, also known as Mel 1-c(alpha). The protein differs from previously known receptors by being 65 amino acids shorter and also having 2 different C-terminal amino acids. The protein is encoded by 2 different alleles (T79063-4) which differ in the 3'
                                                                                                                                                                                                                                  phosphodiesterase.
                                                                                                                                                                                                                                       untranslated region (both sequences encode the same protein), which is thought to affect the half-life of the mRNA. The coding sequence was isolated from CDNA derived from Xenopus skin RNA and amplified using the primers T79067-76. The nucleotide sequence encodes a 7 transmembrane receptor involved in cellular signalling. MEL-lAa has been shown to inhibit adenylyl cyclase, but both proteins can modulate intracellular CGMP, esp. inhibiting its accumulation induced by an inhibitor of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            receptor designated MEL-IAb, also known as Mel 1-c(beta). The protein differs from previously known receptors by being 65 amino acids shorter and also differs throughout the sequence by 6 amino acids. The protein is encoded by 2 different alleles (T79065-6) which differ in the 3' untranslated region (both sequences encode the same protein), which is thought to affect the half-life of the mRNA. The coding sequence was isolated from cDNA derived from xenopus skin RNA and amplified using the primers T79067-76. The nucleotide sequence encodes a 7 transmembrane receptor involved in cellular signalling. MEL-IAb has been shown to modulate intracellular cGMP, esp. inhibiting its accumulation induced by an inhibitor of phosphodiesterase, but unlike the MEL-IAb protein, it cannot inhibitor daminimum and the metallic accumulation induced by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New nucleic acid encoding functional melatonin receptor of Xenopus for screening for potential (ant)agonists useful for e.g. treating cardiovascular disease and cancer

Phosphorylation sites in the encoding bnA may be involved in receptor regulation. Primers from the encoding bnA may be used for isolation of sheep, mouse and human receptor sequences. Receptor fragments which interact with melatonin, or specific antibodies; may be used as receptor-agonists or receptor-antagonists. Agonists may be used in therapy of circadian rhythm disorders such as jet-lag or day-night cycle disorders, to control ovulation, or in alteration of reproductive cycles in seasonally breeding animals. Antagonists may be used to control the initiation or timing of puberty in humans. The receptor gene may also be expressed in a transgenic animal for use as a model system to screen agonists and antagonists.

(W19103-09) are members of a novel family of presumed (W19103-09) are members of a novel family of presumed 7-transmembrane domain receptors that are evolutionary independent of the odorant receptors of the main olfactory epithelium (WOE). Their amino acid sequences were deduced from cDNA clones (see also T69545-50, VN2 sequence not provided) obtd. by differential cloning, PCR and hybridisation from single vomeronasal sensory neurons (VSN). Individual neurons express different complements of the receptors. VN polypeptides can be expressed in host-vector systems for use in identifying modulators for control of maternal, reproductive and social behavior, to increase fertility, control
                                                                                                                                                                  Nucleic acid molecule encoding vertebrate pheromone receptor - useful to identify modulators for control of reproductive and social behaviour, fertility and hormone secretion

sequence from human GLUT-1 (see W17835) operatively linked to a contiguous amino acid sequence from rat GLUT-2. The GLUT-1/GLUT-2 chimeric transporter confers glucose sensing capacity to a cell without rendering the cell subject to diabetic immune destruction, and does not transport streptozotocin. The chimeric transporter may be expressed in vivo by administration of a claimed chimeric polynucleotide (see T66495-96) for treatment of diabetes, or expressed in a host cell to prepare a recombinant cell that secretes insulin in response to glucose and which can be administered to a patient to treat diabetes. GLUT-2 can also be used in claimed methods of cell killing, such as negative selection and double seletion protocols in vitro, in screening methods for identifying genes, promoters and substrates, and in cell killing in
                                                                                                                                               vivo, such as may be used in cancer treatment.
                                                                                               Sequence

CC Y13344-403 represent secreted and transmembrane human proteins.
CC The cNNA sequences are obtained from CDNA libraries, prepared from CC fetal lung, fetal kidney, fetal brain, fetal liver and fetal retina.
CC The encoded polypeptides have specific uses based on their homology to CC known polypeptides, e.g. PRO217 and PRO217 can be used for disorders CC associated with the preservation and maintenance of gastrointestinal CC uncosa and the repair of acute and chronic mucosal lesions (e.g. enterocolitis, Zollinger-Ellison syndrome, gastrointestinal CC ulceration and congenital microvillus atrophy), skin diseases associated with abnormal keratinocyte differentiation (e.g. psoriasis, epithelial CC concers such as lung squamous cell carcinoma of the vulva and gliomas), CC potent effects on cell growth and development, diseases related to growth CC or survival of nerve cells including Parkinson's disease, Alzhelmer's CC disease, ALS, neuropathies or cancer. PRO265 can be used as for CC fibromodulin, e.g. for reducing dermal scarring. PRO264 can be used as a target for anti-tumor drugs. PRO33 may be used in the treatment CC of Usher Syndrome or Atrophia areata; PRO269 can be used as an anti-thrombotic agent; PRO287 polypeptides and portions may have
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  21-NOV-1997;
